

# WATER DAMAGE RESTORATION

*The Dry Air Specialists*

## **DST dehumidifiers:**

- **Standard sized spigots**
- **Robust construction**
- **Washable SSCR-rotor**
- **Easy to service**
- **Low weight**

## **Robust dehumidifiers**

Water damage often occurs in narrow and cold buildings. In those kind of environments, the equipment must be robust, easy to install and easy to handle. All DST dehumidifiers are in stainless steel and are developed to endure tough environments.

## **Easy to handle**

The smallest DST dehumidifier is 12 kg and has one side free from spigots so that it can be placed against a wall. The DR-units may be placed on top of each other and the feet are adjustable. The 'slide' system makes the dehumidifier easy to dismantle for both internal cleaning and servicing.

## **Large mobile dehumidifiers**

Large dehumidifiers get mobile with wagons. For serious water damage, the R-060BR (see photo below) is often used. It can be equipped with a wagon which can

*Recusorb R-060BR*

*Recusorb DR-020*

easily be mounted/demounted. Also the A-30B/Bp offers the wagon as an option.

## **Easy to connect**

All DSTs dehumidifiers for water damage restoration have standard sized hoses to simplify air connections. The A-30B/Bp does not need any wet air outlet since it condenses out the water into a container. The container is equipped with a floater which turns off the unit when the container is full. The water can also be led to nearest drain via a standard flexible hose.

## **Dehumidification of cold rooms**

All DST dehumidifiers for water damage restoration are sorption dehumidifiers and operate below 0°C.
